In a bitmap format, every individual pixel or dot in the image contains a specific color; when you combine all the dots together they combine to form an image that you see as a single picture rather than as the individual dots. But since there are only a certain number of dots in an image, if the image is displayed in a larger or smaller space than intended, the image loses resolution and becomes fuzzy. Vector format A vector image, instead of storing individual dots, stores equations that describe all the different lines and areas in the image. When the image is displayed, the equations are used to draw all the lines and areas to fit whatever space the image is displayed in. Because they scale so well, vector images are often used for logos and other design work in programs such as Adobe Illustrator.
