

Chapter 1 : Creating Effective Javahelp Java Series By Lewis Kevin Paperback Simple Step Faster Receiv

Creating Effective JavaHelp works through a sample help system from Sun and shows you how to create a simple, custom help system to illustrate these concepts. For developers, the book ventures into a discussion of the JavaHelp APIs, which allow a program to call up context-sensitive help at run-time.

With Safari, you learn the way you learn best. Get unlimited access to videos, live online training, learning paths, books, tutorials, and more. No credit card required Using JavaHelp for Online Documentation With so many options for online help systems, you may wonder why you should use JavaHelp or how it compares with other online help systems. JavaHelp may be not only the best online help system to use with your Java applications or applets but also a great source for providing online documentation in general. If you are designing online help for a Java application, JavaHelp is the best help system for the job. Since JavaHelp is written in Java, it is platform-independent and guaranteed to run in any environment in which its associated Java application runs. JavaHelp offers many online help-presentation options. You can design it for standalone, context-sensitive, or embedded modes; you can also use other standard help features such as pop-up windows, secondary windows, and multimedia integration. Finally, JavaHelp is easy to merge and update. If you have different software applications with different HelpSets, you can merge them so that users see a single, integrated online help system. Most help authors are familiar with WinHelp, an older Windows help system that provides online documentation with Windows-based applications. Today there are an increasing number of online help options, most of which are based on HTML. Having many online help systems to choose from, however, makes it more confusing for help authors to decide which help system to use under which situation. It is not the position of this book to tell you which help system to use in different situations—only to help you recognize circumstances for which JavaHelp is your best online help solution. The only situation where I would not recommend using JavaHelp is when you want to incorporate an online help system into a non-Java application. Because of the different environments, other online help systems are better for different platforms. For example, an application developed with Visual Basic would not be well suited for JavaHelp. You could certainly use JavaHelp, but using the Java runtime environment only for the online help system would not be worth the required resources. Instead, a more compatible online help system such as WinHelp or HTML Help would work better with the application and integrate more smoothly with the development environment. Since JavaHelp is platform-independent, it offers a solution for general online documentation. Online books and reference material can be distributed through JavaHelp, since users of all platforms can access it. For example, the Aviation document illustrated in Figure 1. When you compare other options for online books, JavaHelp emerges as a viable solution. For example, you could use ASCII text files to distribute cross-platform documentation; however, you would not be able to use user-friendly navigation controls or add images and text formatting as with JavaHelp. If you want to use a more sophisticated documentation tool such as Microsoft Word to add navigation, images, and text formatting to your documentation, you have to deal with more complex issues with regards to portability and user software requirements. Get unlimited access to videos, live online training, learning paths, books, interactive tutorials, and more.

Chapter 2 : Creating JAVA 2D Graphics : javahelp

Creating Effective JavaHelp covers the main features and options of JavaHelp. It shows how to create a basic JavaHelp system, prepare help topics, and deploy the help system in an application. It shows how to create a basic JavaHelp system, prepare help topics, and deploy the help system in an application.

The best free Java tutorials are: Posting rules in short Rule number one: Use the "Solved" flair instead. Use the search function to find similar problems before posting. No "Do my homework" posts! Do not ask for complete solutions. What have you tried? Post your questions here so that other people can learn as well. No promises of rewards of any kind! Do not reply with complete solutions, rather comment explanations and guides. Comments with solutions will be removed and commenters will automatically be banned for a week. Post titles must be descriptive. How can I sort values without loops? Describe the problem and what you want to achieve. Code posting No screenshots of code! Do not submit executable jar or compressed zip, rar, 7z, etc. For small bits of code less than 50 lines in total, single classes only , the default code formatter is fine one blank line, then 4 spaces before each line. Pastebin for programs that consist of a single class only Gist for multi-class programs, or programs that require additional files Github or Bitbucket repositories are also perfectly fine as are other dedicated source code hosting sites. Ideone for executable code snippets that use only the console Repl. Check out the wiki for frequently asked questions. Please feel free to contribute!

With the release of JavaHelp, there is a complete and standard online help system for the Java platform. Creating Effective JavaHelp covers the main features and options of JavaHelp. It shows how to create a basic JavaHelp system, prepare help topics, and deploy the help system in an application.

With Safari, you learn the way you learn best. Get unlimited access to videos, live online training, learning paths, books, tutorials, and more. They proposed the best online help solution for Java applications and applets, and offered a great source for online help and documentation in general. We are entering an age in software documentation where new HTML-based help systems are emerging and are trying to provide solutions for all help-authoring needs. With Java becoming such a widely used programming language, help authors need an HTML-based help system that is as flexible as the Java applications themselves. JavaHelp to the rescue! To get you started learning JavaHelp, this chapter provides the following topics: JavaHelp is an online help system developed in the Java programming language. As shown in Figure 1. Using this tripane window, users select an item from the navigation pane, and the corresponding help topic appears in the content pane. If a help topic contains a link, the user can click it to display the corresponding HTML page in the content pane. If the link leads to another topic in the same HelpSet, the navigation pane automatically updates itself to highlight the title of the new topic. The HelpSet Viewer also supports pop-up windows, secondary windows, and multimedia clips. Java programming is required to provide a Java multimedia component for use with the HelpSet Viewer. Like other help systems, JavaHelp can present help information to users in several ways: Application-level help The user enters at a top level, such as an introductory topic or a table of contents. Field-level help The user selects a specific application control such as a text box or button on which to obtain help. Also, JavaHelp integrates seamlessly with Java applications. Since JavaHelp runs with the Java platform, it runs in the same process as the Java application for which it is created. Get unlimited access to videos, live online training, learning paths, books, interactive tutorials, and more.

Chapter 4 : Using Field-Level Context-Sensitive Help - Creating Effective JavaHelp [Book]

The best way to start this discussion is to explain the way users don't read online help. They don't read online help the way you are reading this book. With online help, the user doesn't read the document from start to finish. There is neither a beginning nor an end to the document. Generally.

Java-Help-System is protected by copyright law and international treaties. The software is free based on one of following three conditions. You are an end user Download the software directly from this site. Or use the software distributed by us or authorized organizations. Education organizations If you are a school, university or any kind of education organizations, you can copy and distribute the software as a whole inside the organization, to your students, teachers and staffs, but the distribution must be for free. Web master Please feel free to announcer the software to your customers, but please use our download link directly. In any other cases, this program, any files, images or any parts of this program can not be copied, reproduced in any form or by any means if without prior written permission from us. If you accept the agreement, you can download it now. Aimed at Java developers and technical writers, creating effective JavaHelp provides a very concise guide to you. The help system provides hyperlinks and browsing capabilities, does a good job at orienting the reader to JavaHelp and how it relates to these documentations. It also includes a short, useful section on project planning for online help. It shows how the JavaHelp standard uses HTML, jar, zip and other files to structure content layout for such options as navigation and the table of contents; help content itself is organized into HTML pages. Creating Effective JavaHelp works through a sample help system from Sun and shows you how to create a simple, custom help system to illustrate these concepts, the Help System ventures into a discussion of the JavaHelp APIs, which allow a program to call up context-sensitive help at run-time. Other sections show how to take advantage of more advanced help features, like using secondary windows to display content or using embedded help within custom abilities. As the Help System notes, third party tools will actually let you deploy help systems to JavaHelp automatically. But this compact text points out the differences and advantages of JavaHelp for creating online help on the Java platform. Until now, Java application developers have been forced to develop their own help system. The help covers the main features and options of JavaHelp. It shows how to create a basic JavaHelp system, prepare help topics, and deploy the help system in an application. Written for all levels of Java developers and technical writers, the Help System takes a chapter-by-chapter approach to building concepts. It imparts a complete understanding of how to create usable JavaHelp systems and integrate them into Java applications and applets. We continues to roll out as fast as you can use. That means you can embed items within it or transport to another destination. The primary component of the Java-Help-System seen by a user is the help viewer, which comprises a toolbar, content pane, and navigation pane. Java Help relies heavily on swing user-interface components. The contents of the help viewer ought to be familiar to anyone who has interacted with a help system. The content pane displays help topics. The navigation pane is a tabbed pane that lets a user select from among the table of contents, index, and text search options. Java Help permits a single help system to support varying "navigational views" of help content. The navigational view is a description of how a particular kind of content is to be viewed. In that sense, it is metadata -- data about data. For example, a navigational view is defined by among other things its format how it is to be shown and data that identifies the format and location of the view. A navigational view is implemented by a Help Navigator, which is a subclass of the JHelpNavigator class a swing component. The Java-Help-System already understands several n navigational views. The table of contents, index, and search information displayed in the help viewer already have navigational views defined. Java Help provides mechanisms for registering new navigational views. The data structure that carries all the information needed to provide a view into a help system is bundled into a help file. Note that there are two "loose" terms at use here. A help file could be bound into an application, for example. The structure of a help is Extensible Markup Language data. The data points to the URLs from which you can find the info necessary to build the help system. One portion of the help file points to yet another structure called the Map file. Each key is a help topic i. The help browser has a storage facility on your hard drive that

stores graphics and text from web sites that you visit. This storage facility is called the cache using very little memory, or temporary internet files. The reason web browsers have a cache is that it is quicker and easier to load images, applets, etc. This can cause problems with Java applets and can result in that Applets are freezing or not working at all. The solution to this is to clear cache and reload the page. If this does not work, try clearing your cache, closing your browser and then revisiting the page. The upshot is that the data structures used by a Java-Help-System are flexible enough to permit a wide variety of delivery scenarios: Help can be bundled into an application, help can be a separate file outside the application, help can be pulled in from across the network, and so on. The architecture is initially daunting, but it looks as if it will serve the broad and ever-broadening needs of Java applications and applets.

Chapter 5 : Creating Effective JavaHelp - theinnatdunvilla.com - Librairie Eyrolles

Effective, instantly available online help is a requirement for today's interactive applications. Until now, Java application developers have been forced to develop their own help system. That's no longer necessary. With the release of JavaHelp[™], there is a complete and standard online help system.

Feedback Your Creating Effective will love Based to a allour of forces for Y, and it may be some crosscurrent before it is often raped formed.
