Res. , directing the Federal Trade Commission to investigate the policies employed by manufacturers in distributing motor vehicles, and the policies of dealers in selling.

Health and lung problems Foreign body in eye Cause of accident in construction? Erection equipment failure
2. Falling of persons from height 3. Non stop working by worker 6. Up safe work methods 7. Collapsing of earth during trench excavation 8. Failure of use safety equipment 9. Working a height without safety belt 51
General safety precautions in construction? Adequate first aid equipment should be kept ready 2. Adequate fire fighting equipment should be available 3. All general electrical rules should be followed 4. Work men at height should be wear safety belts 6. Work men handling cement should be provided with goggles, rubber gloves and rubber boots by nose mask. The moving parts of grinding machines used construction site should be covered with guards 8. The moving parts of grinding machines used construction site should be covered with guards 9. Excavated material should not kept near the excavated Very short duration of work red flags must be hoisted and more duration red banners must be stretched Defective tools should not be used The worker should not carry tools in his hands when climbing a ladder Excavation should be guarded by suitable fencing How to erect scaffolding? It should be erected on levels firm ground 2. It is constructed using metal pipes and wooden boards 4. It should be design and constructed from good and sound material 5. Not to be erected on loose earth 6. Clamps should fixed 8. Sole plate is necessary the base of vertical pipe Safety precaution of scaffold? Wooden board not be painted 2. Wooden board should not to any cracks 3. Clamps should fixed and good quality 5. Boards thickness should be 3. The construction must be rigid, properly based 7. Use of good and sound materials 8. The wooden bellies has not joints 9. Vertical poles should not be more than 6 feet Chains, ropes used for the suspension of scaffoldings Never throw any materials from height Use safety harness while working at above 6 feet Properly ties to be arrangement 54 What control measures area necessary in confined space? Enter with air line BA sets 2. Use 24v flame proof hand lamps 3. A hole watch to be kept near man hole 4. Keep fire fighting equipment ready 5. Gas test to be done to check for oxygen level 6. Use ropes and harness 9. The spaces clean before entry Use non sparking tools it there is any risk of flammable vapors being present. Safety rules when using ladders? The foot wear is not greasy, oily and muddy and has a good grip on the rungs. When climbing or coming down a ladder should be face the ladder side and had on with both hand. Carry light tools in pockets in a shoulder bag. Hold on with at least new hand if use of both hands then, use safety belt 5. Never climb higher than the third rung from the top on straight or second tired from the top on extension ladder. Step ladder must be fully open and the divider locked 7. Metal ladder shall not be used near electrical equipments. Metal ladder shall not be place on firm footing and at angle of 75 9. Any ladder found defect in any way should be marked do not use Ladder shall not be placed on a box or drum. Rubber protection on head and heel of a ladder is necessary. Safety rules insuring oxygen cylinders? Oxygen cylinders should not be kept near combustible materials. Oxygen cylinders should not be handled with grassy hands or gloves. Oxygen cylinders and their fittings should not be tested with oil based soap solution. Oxygen cylinders and other combustible gas cylinders should not be stored together. The top cover of the cylinder should be kept in position and screwed safety when not in use. Cylinders should not be used as rollers for moving materials 7. Oxygen must not be use for ventilating confined spaces. Safety rules in using compressed air? Only authorized persons should used compressed air. The body or clothes should not be cleaned with compressed air. Compressed air hose pipes should not be placed across passage ways 4. Leakage of compressed air should not be tested with hands. While working with tools run by compressed air safety shoes are to be used. The tools should not be kept on position when not in use. Handling of compressed gas cylinders? They are not to be dragged or dropped 2. They should be stored in dry and well ventilated places 3.

Motor Vehicle and Fleet Management Best Practice Guidelines 5 Injured Employee: Explain Workers' Compensation coverage. Workers' Compensation will apply as exclusive remedy to employees injured in a vehicle collision while engaged in the course and scope of one's duties for the university.

Thompson Hine LLP USA February 7 Just about every business is at risk for an accident claim, be it by a visitor, an employee in the workplace, or someone using one of its products. Here are some of our recommended best practices for conducting a proper accident investigation. Establish an Accident Investigation Team. This step is important not only because insurance policies often have strict notice provisions, but also because the insurer likely will conduct its own investigation, information from which will benefit the company. Furthermore, the company should determine in advance the extent to which it will involve legal counsel in accident investigations. Adding to the benefit of guidance regarding accident-risk management and its help with significant legal parts of the protocol e. Finally, the company should inform all employees that there is an accident investigation team and protocol in place, and make clear that employees: Must contact the team leader in the event of an accident Must not attempt to conduct their own investigation Must not make any statements about the accident without prior team leader approval; this requirement will help forestall the making of statements or documents that could pose serious challenges in litigation Gather Information From and About the Injured Person. Ask for as much information as possible from any person injured, or allegedly injured, in the accident the claimant or from his or her lawyer. Dockets for civil and criminal actions are available online and can be searched by name. The Internet is a valuable resource for other information via Google or Yahoo searches. It is important, however, to search only for publicly available information on social media. Instead, depending on the nature and severity of the claimed injury, the company may want to engage an investigator to surveil the claimant to determine the veracity of the claim. Investigate the Product and Accident Scene. If possible, the company should involve an expert who can determine the cause of the accident and whether a product presents a safety concern. Working with an expert or not, keep the following in mind during an inspection: If the company owns a piece of equipment involved in an accident that must be repaired and put back to use, notify all potentially interested parties and give them an opportunity to inspect it before any repairs are made; if the company does not own it, send a letter to the owner explaining the legal obligation to preserve the evidence Gather Documents. Myriad documents and evidence surface when an accident occurs. Create a checklist the investigation team can use to ensure that all relevant documents have been gathered and preserved for evaluation in determining the cause of the accident. Below is a non-exhaustive list of common documentary evidence associated with accidents: Aerial photographs of the scene Autopsy report and coroner photos EMS report and photos Fire department report and photos Insurance company records for all insurers with whom a claim could have been made Media coverage print, broadcast, and electronic Police accident report and photos Probate court file Reports that must be submitted to government regulators e. Equipment and other workplace logs Equipment files and manuals.
