Chapter 1 : JEWELLERY MANAGEMENT SYSTEM - Free Student Projects

Jewellery Shop Management System is the inventory software application developed using Visual basic and all the transaction record stores in Microsoft Access Database. Jewellery shops can use this software to their day to day transaction.

Products out for repairs. Sales orders awaiting back-ordered products for completion. Prior to a physical count it is important that you first know whether such goods need to be included in the count or not. So you will record wrong data in the end. Cycle Calculations This is the process of incompletely counting products on a sustained basis so you may stay on top of stock levels without having to disrupt regular store operations. If you feel that you may not be relaxed with cycle counting, the guidelines mentioned below must come handy. Setting up before Time It completely depends on you to conduct your physical inventory counts when and how oftentimes. A few stores do it once a year, others on a bi-annual basis, while certain stores do it more often. When you come to this stage, you need to take down the names of the people who will be helping you with your substantial inventory count. Confirm they can be available and do not get stuck up anywhere else. You would not be absolutely like to halt store manipulations, so if possible try to plan your inventory count after business hours. Or inform your customers ago to this if you could build it after business hours. Draw out the location of every rack, display, enclosure, and shelf if essential. This will allow you to have total view of your store and you can entrust people to every sections who in twist will start the counting process adroitly. Extra, your map will also work as checklist where you can trace the block covered and the section arrears. Tag Shelves and Boxes It would not be intelligent if you incautiously start the counting process without any kind of prior work of marking the stock particularly if products are invisible. Try to find rid of all the loose boxes and strayed pallets by putting them in any temporary place for the time being. Stay an eye for whichever product which is out of place for example a diamond ring in the gold ring section. Make sure all is at the right place. Orient Manpower Make sure that you staff is entirely conscious of your plans and their function in your expedition. They must not be distraught about any changes you just made. So you inform them previous to start of the work. You can take a walk in stock room to show them the place; this will acquaint them which will provide better output. Go For Computerized Method With all going digitized you may require to spare the traditional pen and paper technique because the chances of error are high. In addition you would not like to compute the data. For more information visit our website:

Chapter 2 : Jewellery Management System Project in theinnatdunvilla.com | Projects

A jewelry shop management system is the answer to both of those questions. A system that tracks sales and provides you with real-time information about quantities on hand and costs of unsold products.

The project is based on inventory. This software is user friendly and error free. This is implemented using the programming language ASP. The database is maintained and cleared according to the periodic time spam. This software reduces the paper consumption, power consumption, time consumption and also the manpower is required is less. There are two possibilities. A customer may visit the jewellery and buy a readymade jewel or order for a jewel as per their design. The customer can pay the amount directly as cash or through cards. Their card number is noted down confidentially. If the customer wishes to order for a jewel, first the customer must select the jewel. The selected jewel is noted in the software along with their name and contact number. It asks if the customer would like to give any advance gold or cash. If so, the cash amount is entered as advance or grams of gold given is noted down. The date to collect the jewel is also noted down and a receipt is given for identification which contains order Id. This order to given to the outside goldsmith worker. Their name is noted down and also saves the order id. When the customer visits to collect the jewel they had ordered, first they need to produce the order id card. Depending upon that jewel and the bill will be produced. After collecting the final amount, equal share is given to the goldsmith for working on it. This amount is saved in the database. Periodic report can be generated through this software. Sample code is available in the below link. If you wish to purchase the actual code, mail us. Support will be provided by our team after the purchase.

Chapter 3 : Online Jewellery Store Project in PHP/MYSQL

Our Jewelry Management solution will make handling of your sales and connecting your business to your Ecommerce presence effortless. With this turnkey solution you will have an All-in-one management system which will easily connect your inventory to your sales floor and help your business thrive.

Jewellery shops can use this software to their day to day transaction. This system has features of Jewel types, Jewelry records module, purchase inventory, sales inventory, Cash In, Cash out, etc. The system is very neatly designed and it generates customized report. Here we shared detailed description of the project with complete source code. Utilities menu Report menu Help menu The utilities module has 7 sub modules. It contains settings and basic modules. All the sub modules of utilities module explained here. Customer database is backbone of the company. Storing customer record is very important now a days because without customer database its very difficult to run any kind of business. The employees can add customers by entering their profile details. Once the customer added those detail stores permanently in the database. Before customer purchase detail the employees need to add customers profile. The suppliers are the supply jewels to the company. In the jewellery shop there are many suppliers who sell different variety of jewels. This module is required to store all the supplier records. The Jewellery types is the master module. In this User can add different categories, units, types, division with type and description. This module stores different jewellery details with description. If the description has details like stone, pearl, gms, carat, purity these details can store in the remark area. In this module user can set unit price of the jewels. While generating bill the system calculates unit price automatically. This employee module allows admin to add new employees. This module allows to stores all the employees record who is working for Jewellery company. Even employees photo can upload in this module. This module allows software users to change the password. If anyone forgets password admin can reset their password by entering Old Password, new password and Confirmation of New password. The system stores database backup in the Microsoft access MDB format. If user clicks on backup database the system will ask the storage path to store the database. The transaction module is the main features of the website. The company is purchasing Jewellery items from seller. This module stores all the purchase records with purchase quantity and purchase price. User should enter purchased item, seller details, purchse code, purchase date, etc. This module stores multiple jewel item purchase details together. The system calculates grand total automatically. This module stores sales record by entering Order number , purchase date, customer details, Jewellery item details, etc. The system generates bill after the sale. Cash In module stores received amount details. Cashout module stores paid amount details. User needs to enter start date and end date to generate report. The system displays total sales and detailed report. User can take print out of generated report. The Jewellery Management System has 16 tables. The database has following tables.

Chapter 4 : Download Jewellery Management System Project in theinnatdunvilla.com Source Code | Proje

Jewellery management system is developed in Visual Basic , which can keep track of all your business activity in a jewellery shop from small segments to large and very large segments. You can make entry, edit, explore, print, backup, restore and other more features available in this project.

NET to manage the different transactions and operations that occur in a jewellery shop. This project provides an effective managing platform to any Jewelry Shop for providing fast, reliable and comfortable service to the customers. After the implementation of this project, the manager can keep records regarding monthly and yearly sales and billing details. You can download the complete source code along with the database files, project abstract and project report form the download links given in the post. The data flow diagrams DFDs are also available for download. The proposed project on Jewellery Shop Management is the an online application designed to deal with the sales and purchasing process in a Jewelry Shop. It enhances the process of recording details and online order of the jewels. The installation and implementation of the project roots out the possibility of occurrence of errors during transaction process. The use of internet and computer is rapidly growing day by day. Nowadays people prefer online shopping to traditional manual shopping to save time. The proposed project, being a web-based software, facilitates the jewelry shop to get online orders and sales via internet. The key features of Jewelry Management System are: The project has been coded in VB. It is designed as a flexible software to enhance the features and modules present. In order to increase the efficiency, data integrity is maintained and redundancy is avoided. It has four interrelated modules to perform certain specific tasks. It provides a much faster, easier and reliable service to the customers. Jewelry Shop Management is a four-modules project: Each module has certain specific function and is co-related to one another. The fundamental tasks to be performed by individual modules have been introduced below: This module is responsible for recording the personal details, attendance, address, salary etc. This module is supposed to update the orders of Jewels in the database and to record details of buyer. It updates the supplier details, stock details and details to the database. The manger of shop can view the stocks using this module. The main function of this module is to perform an analysis of bills to generate the entire transaction process in a report format. It generates sales report, purchase report, bill reports, etc.
