April 10, Height: Brown hair, brown eyes. He has a small tattoo of a dollar sign behind his right ear. Teresa lent Matt her car and asked if he could pick up some cat food on the way home. That night, when he left their house, Matt took only his bank card with him. He left his wallet at home. Teresa believed that it would take just fifteen minutes for Matt to complete this errand; however, he never returned home. The next morning, when Matt still had not returned, Teresa and Steve called the police. They then called the bank. Steve pretended to be Matt in order to determine if any transactions had been made on the account. The bank confirmed that several transactions had attempted to be made. When the Dahls told this to the police, they knew that something bad had probably happened to Matt. Authorities theorized that Matt was trying to signal for help. Matt attempted to withdraw cash two more times that night. Eleven minutes later, the card was used again at a different branch in a different neighborhood. Again, the withdrawal was unsuccessful. This time, a hidden camera took photographs of Matt. The photographs revealed something disturbing: Authorities suspect that Matt was abducted shortly after his first transaction by the man in the photograph. It is believed that he deliberately entered erroneous amounts in order to attract attention and signal for help. Over the next day and a half, there were five more withdrawal attempts. Finally, the card was confiscated from the machine after the Dahls placed a freeze on the card. They hoped that the police could obtain fingerprints from the card; however, no fingerprints were found. It is believed that the card was either wiped clean or the abductor used gloves. Authorities suspected that Matt may have been injured in a mugging and was walking the streets with amnesia. The car was examined, but no usable fingerprints were found. However, they did find a blue bandana that did not belong to Matt or Teresa. Authorities believe that it was left by the abductor. Composite 1 of the suspect Composite 2 of the suspect Bandana left by the suspect Bank surveillance photo Additional photographs of the suspect 1 of 5 Add photo Suspects: No suspects have been named in this case. The bandana has the following letters written on it: Two composites have been made of the abductor. The abductor was described as somewhat shorter and somewhat stockier than Matt. This case first aired on the December 21, episode. According to TV Guide, it was originally scheduled to air on the November 23, episode, but it was postponed. The cause of death was a gunshot wound. Authorities believe that he was killed shortly after his disappearance. The case has since been "cleared" by police. Ironically, he was killed on June 10, , just two days after Matt vanished. It is believed that Meza was killed by other gang members. Other circumstantial evidence also linked him to the crime. However, the possibility still exists that there were accomplices involved.

Two-thirds of the settlers were mestizo or mulatto with a mixture of African, indigenous and European ancestry. Americans took control from the Californios after a series of battles, culminating with the signing of the Treaty of Cahuenga on January 13, 1847. On September 14, 1850, the Los Angeles City Council promulgated residential and industrial land use zones. The new ordinance established three residential zones of a single type, where industrial uses were prohibited. The proscriptions included barns, lumber yards, and any industrial land use employing machine-powered equipment. These laws were enforced against industrial properties after-the-fact. These prohibitions were in addition to existing activities which were already regulated as nuisances. These included explosives warehousing, gas works, oil-drilling, slaughterhouses, and tanneries. Los Angeles City Council also designated seven industrial zones within the city. However, between 1850 and 1860, Los Angeles City Council created various exceptions to the broad proscriptions which applied to these three residential zones, and as a consequence, some industrial uses emerged within them. There are two differences from the Residence District Ordinance and later zoning laws in the United States. First, the laws did not establish a comprehensive zoning map as the New York City Zoning Ordinance did. Second, the residential zones did not distinguish types of housing: During the war, more aircraft were produced in one year than in all the pre-war years since the Wright brothers flew the first airplane in 1903, combined. Manufacturing in Los Angeles skyrocketed, and as William S. Knudsen, of the National Defense Advisory Commission put it, "We won because we smothered the enemy in an avalanche of production, the like of which he had never seen, nor dreamed possible. The 1940s saw race relations boil over into the Watts riots of 1965 which resulted in 34 deaths and over 1,000 injuries. Army, Navy, and the U. Marine Corps were called in to assist local police in curtailing the violence. The riots were the largest in U.S. history."

California State Resolution, commending Direct Relief for work in Haiti after the Earthquake Stepping Up Award, for outstanding work in GIS following the Haiti earthquake, ESRI Community Clinic Health Star Award, Community Clinic Association of Los Angeles County.

It all depends on your point of view, explains Communications Director Matthew King. As a surfer, I hate the rain. As a Californian, I love it. The recent series of downpours has kept me out of the ocean for weeks. Maybe the deluge up north has been a boon for our parched state. Does all this rain mean the drought is over? The recent rain might temporarily relieve drought effects, but it is not a cure-all. Yes, reservoirs up north may be filling again, but SoCal reservoirs are still dry. It will take years for our depleted groundwater aquifers to catch up. A good analogy is relating the drought to your credit card: You have temporary relief, but you still have a lot of water debt to pay off from the water you took out before. We require much more water to reach healthy and secure levels. Locally, our regional infrastructure is not set up to store rainwater or capture runoff, and reuse it. The system is currently designed to move rain water to the ocean as fast as possible. In an era of permanent drought, we simply must do a better job of using the water we already have by investing in innovative infrastructure projects that capture and reuse stormwater. We need to capture and infiltrate water on-site, replenishing aquifers instead of funneling runoff uselessly to our seas via the stormdrain system. A photo posted by Sol Angeles solangeles on Jan 5, at 2: What needs to be done to improve stormwater capture in Los Angeles? Runoff “if held, filtered and cleansed naturally in groundwater basins” can provide a safe source of water for human use. That means building so-called multi-benefit projects like green streets, water-smart parks and low-impact commercial development. Philadelphia and Portland have made enormous strides in treating stormwater as a resource rather than a nuisance, and so can we. The city of Los Angeles, for example, has created an ambitious master plan for stormwater capture. But all this innovative replumbing requires capital. Heal the Bay has joined a broad array of environmental and business groups asking regional lawmakers to craft a public-funding measure, perhaps in the form of a reasonable parcel tax. Jan 9, at 7: The rain increases supply, but what about reducing demand? Most conversations about water in our state revolve around supply. We often fail to talk about demand, and how we can reduce the strain put on our unreliable delivery system by simply being smarter about the water we already have. Los Angeles residents have done a remarkable job of reducing their average daily per-gallon usage over the past decade, but we can still do better. A good place to start is rethinking our love affair with gardens and lawns in arid Southern California. I thought rain was a good thing. Why is Heal the Bay worried about it? Yes, we desperately need rain. But rain creates urban runoff “the No. As a Large Storm Rolls into L. How does rain create pollution? Rimmed by foothills and mountains, Los Angeles County is like a giant concrete bowl tilted toward the sea. How do stormdrains trash the beach? With memories of historical deluges on their mind, engineers designed L. Moving stormwater out to sea quickly was their number one goal. But it also has the unintended function of moving trash and bacteria-laden runoff directly into the Santa Monica and San Pedro Bays, completely unchecked and untreated. An average one-inch storm will create about 10 billion gallons of runoff in L. Nov 30, at What does all this runoff have to do with the ocean and marine animals that call it home? Hundreds of thousands of animals each year die from ingesting trash or getting entangled in human-made debris. Seawater laden with chemicals and metals makes it harder for local marine life to thrive and reproduce. What about the human health impacts? Beachgoers who come in contact with polluted water after storms face a much higher risk of contracting illnesses such as stomach flu, ear infections, upper respiratory infections and skin rashes. A UCLA epidemiology study found that people are twice as likely to get sick from swimming in front of a flowing stormdrain than from swimming in open water. How can ocean lovers stay safe during the storms? Your donation will underwrite volunteer cleanups, citizen data-collection efforts and advocacy efforts by our science and policy team to develop more sustainable water policies throughout Southern California.
