When it comes to image viewers, Windows users can select from a wide variety of free and commercial tools: Some keyboard shortcuts work out of the box, like left and right to flip through photos. If you prefer to use the mouse, you find a small navigational tool attached to the bottom of the screen that you can use to quickly browse to the next or previous item. Additionally, you may right-click on the icons to jump ten photos ahead or back, rotate the image, lock the controls, zoom in or out, and use a slider to jump to another part of the collection quickly. You can display or hide EXIF information if available. If you enable the feature with a click on EXIF in the interface, information such as the make and model of the camera, and other technical information are displayed on the photo. Additional controls are displayed in the main toolbar at the top. You can change the View mode, for instance to fit images on the screen or display them in full size all the time, or run a slideshow by selecting the time in seconds between images, and effects. There is also an option to bookmark an image, and to use light editing tools to resize or rotate the active picture. The edit menu displays options to set the image as the background on the desktop, to copy it to the clipboard, and to open it in the default image editor on the system. Last but not least, a copy to folder option is provided that you may use to copy active images to a folder you have added previously. This can be used to go through a collection of photos quickly to move a selection to a folder for further processing or uploading to the Internet.

File Support One of the most important features of an image viewer is its support for file types. If it only supports a few, it may not be suitable for you. Honeyview supports major image formats, including jpg, gif, png, bmp, tga as well as psd, webp, pcx and other lesser used formats. The image viewer supports RAW image formats as well, and can display images found in compressed file formats as well. This includes zip, rar and 7z, but also formats that are simply renamed such as cbr. Verdict Honeyview is a fast image viewer for Windows with excellent image format support and options that make it interesting for quick reviews of large photo collections. While it is no FastPictureViewer Professional, it should be suitable for most home uses.

To open an image from the web in Chrome, right-click it and select the 'Open in Image Viewer' option. This opens the image in the same tab, fades out the rest of the web page, and allows you to rotate, zoom, and pan it at will.

We know that it can convert videos or stream them from online sources. Videos can be rotated, flipped and even transposed for different purposes. Videos can be simply rotated by clockwise 90 degrees, degrees, and degrees. You can also rotate the video by arbitrary angles such as 1 degree, 27 degrees and so on. Besides rotating, videos can also be flipped horizontally and vertically. Finally, videos can also be transposed or anti-transposed, which flips and rotates the videos at the same time. There you will find options to do the following to your video: Rotate by Fixed Angle: Click on transform, to rotate a video by a certain fixed and a standard number of degrees: Those can be selected from the drop-down after you check the transform button. Transpose is when your video is rotated degrees clockwise and flipped horizontally. Anti-transpose is the result when your video is rotated by 90 degrees clockwise and flipped horizontally. Rotate by Certain Angle: Move the angle dialer around. Your video will be rotated by a certain arbitrary degree. Remember that this rotation setting is saved and when you open a new video, it will still be rotated. You will have to come to this section to uncheck the boxes to disable rotation for playing other videos. In the Convert dialog, click on Settings next to the Profile. Activate the Rotate video filter if the video was rotated at an angle like 59 degrees. Hit Play to begin the transformation process. The video will be rotated and the changes will be permanently saved in the destination file. If the player minimizes, bring it back up. If the transformation process has not started, press Play in VLC controls. The position seeker will show the progress of the conversion. Some Uses of Rotating a Video Correcting a video that has been taken in the wrong way or angle. For example the person who took the video decides to rotate the camera device while taking the video. One way to watch it normally is to rotate it by VLC. Watching the video in style by rotating it in a certain angle. Filling up a portrait video of the entire area of a widescreen. In such a case, rotating the video by 90 degrees or degrees will help fill up the entire monitors which have more width then height normally. Hello, I have rotated a video;however, 1. It plays in VLC perfectly. Any thoughts why 1 and 2 happen and how to fix them?

Rotate photo to left counterclockwise Rotate photo to right clockwise Delete photo Adjusting Picture Magnification Windows Photo Viewer automatically scales photos to fit in the current window. If you want to see how sharp your photo is, or need to view a portion of your photo, adjusting the magnification is helpful. Open the photo in Windows Photo Viewer. Click the slider at the left end of the controls below the photo and move it upward until you reach the desired magnification see Figure 4. To adjust what portion of the picture fits into the display window: Move the mouse pointer into the photo. The default pointer turns into a hand. Click and drag the photo until you see the desired portion of the photo inside the Windows Photo Viewer window. Release the mouse button. NOTE The magnification adjustments affect only viewing size; print size is set by the settings used by your printer. To rotate a photo: If the top of the photo faces left, click the right curved arrow. If the top of the photo faces right, click the left curved arrow. Click the forward or back arrows to save changes to the current photo and display another photo. If you need to rotate a photo stored on read-only media, copy it to your hard disk and then rotate it. Each photo displays full-screen. By default, slide shows play in a loop at medium speed. However, you can also advance to the next or previous photo manually, pause the show, shuffle picture order, and select fast or slow playback speeds. To adjust playback options, do the following: Right-click the display after starting the slide show. Select the option s wanted see Figure 4. Click away from the menu to put changes into effect. To close the show and return to the normal Windows Photo Viewer display, click Exit. Using the File Menu The File menu includes options to: Delete the current photo. Make a copy of the current photo into any folder. Copy the photo to the Windows Clipboard. Display image properties, including exposure metadata see Figure 4. The Print menu provides two ways to print: Select Print to make prints with your own printer. Select Order Prints to order photos from a variety of online photo print providers see Figure 4. You can select multiple prints and use its Print menu to order prints. Learn more at <http://> To learn more about printing photos with any Windows 7 application, see "Printing a Picture" later in this lesson. Emailing a Picture Windows 7 does not include an email program. Select another option for the Pages of any orientation drop-down menu if you wish to apply the rotation only on landscape or portrait pages. Click OK. Click OK. Click the menu beside Run commands on.

The drop-down menu lists long-text fields that contain text for the current document open in the viewer and those you have permissions to. Extracted text mode provides the following options: In Extracted text mode, this pane shows the persistent highlight term count per page of an open document. Navigate between pages using the viewer paging control in order to view the persistent highlight term count for other pages of a document. Your zoom setting persists as you navigate through a document set. Reset zoom - resets the zoom function to percent. Find previous and next - searches for terms on the current page of an open document and navigates through the hits on the page. Entering a term and either clicking the left or right arrow button or pressing Enter in this text box scrolls to and highlights the text of the next instance of the term from the placement of the cursor. Search hits return for the current page open in Extracted text mode. Navigate between pages using the viewer paging control in order to search for terms on other pages of a document. Searching in this text box is not case sensitive Search results match partially-entered words. Matching is done on the literal character typed into the search-box, including non-alphanumeric characters. Fit Width - fits the document to the window. This function is only available in the preview mode. Navigate between pages using the viewer paging control in order to view persistent highlight terms found on other pages of a document. Productions mode When you switch to Productions mode, the viewer toolbar displays a drop-down menu of available production sets that contain the document currently open in the viewer. For information about creating production sets, see Production sets. The redactions that are burned into a produced image are the redactions that were on the image at the time that you produced it. Select a production set from the drop-down menu to see how a document was produced in the selected production. Productions mode provides the following options: Fit Actual - fits the document display to the actual size it was in its native application. Fit Width - increases the size of the document to fit the maximum width of the viewer. This setting persists when you re-size the window. Fit Page - fits the entire document into the total size of the page. Clicking this zooms out the document and reduces the font size. Rotate all pages - rotates all pages in a document clockwise 90 degrees. Rotate current page - rotates only the current page clockwise 90 degrees. Image rotation is persistent. Any pages that you rotate will be rotated the next time you return to them in the viewer and for other users who view them after you rotate them. Rotation is also applied when you run the production containing the images. For more information, see Saving an image as a PDF. About - displays the version of the production viewer. The icon is red if a version is out of date. Imaging on the fly You can image a single document on the fly using the Image button in the viewer. Using this feature, you can select any imaging profile you have permissions to view and use it to image the document. If the source file of the document you are imaging is changed during the conversion process, for example through overlay, that document becomes undeliverable and you receive an error. To resolve this error, refresh the page or re-image the document. After imaging a document on the fly, you can access thumbnail renderings of the imaged pages of the document. See Adding information to CaseMap. Imaging some file formats can cause problems. Many PDFs render and image very well. However, you may have problems rendering and imaging some PDFs due to the variety of their content. While most Microsoft Office documents render and image well, you may experience issues when imaging documents with embedded files. You may have problems rendering and imaging vector-based documents like Visio and CAD. For more information, see Viewer-supported file types. The default priority for all image-on-the-fly jobs is determined by the current value of the ImageOnTheFlyJobPriorityDefault entry in the configuration table. Image-on-the-fly process The following graphic and accompanying steps depict what happens behind the scenes when you run an imaging job. These apply to imaging sets, mass imaging operations, and image-on-the-fly requests. This is for reference purposes only. The number of requests per batch is configurable. Invariant writes the images contained in the request to a temporary location on the file server. Completion notifications are sent for every document. The conversion API writes files to a permanent

destination directory in the file server. Stand-alone document viewer To view the document in a separate browser window, click the stand-alone document viewer icon in the upper right of the core reviewer interface. This opens another viewer pane with an Unsynced designation at the top of the screen. To synchronize the standalone viewer with the core viewer, click Unsynced. This switches the stand-alone viewer setting to Synced where you can view text and images, natives, and productions side-by-side while navigating through the document queue. Keyboard shortcuts are available for use in the stand-alone viewer. Related items pane The related items pane is located at the bottom-right corner of the core reviewer interface. Related items are customizable groups of documents within a workspace. Common examples are family groups, duplicates or similar documents. The related items toolbar includes the following: Related items - displays a group of documents related to the active document. Options vary within the workspace. Hover over each icon to display the name of the item. Document history - displays a history of actions taken on the current document. You may not have access to document history. In the document history pane, you can click the Details link to display a pop-up with the audit history for the document. Click Run Details to display information about document imaging jobs, including the name of the imaging profile and the formatting options used during mass imaging or imaging on the fly. Production - displays all productions in which the document was included. You may not have permissions to view production information. Linked - displays all linked records on the active document. For more information on linking documents, see Links. Search results - displays the results of a Relativity Analytics search. You may not have permissions to view this section. Use the related items pane to quickly identify documents related to the active document. You can also use this pane act on those groups of related items. For instance, in the example of the related items pane below, the active document is highlighted and listed with two related family documents. You can select some or all of the documents in the related items pane and click Go. This opens a window for you to access all of your active layouts – the same layouts available in the layouts pane. Using these layouts, you can make coding decisions and apply them to the selected documents using mass editing. Quickly scan, locate, and navigate to pages in an open document.
