

Chapter 1 : Is there a way to delete files instantly on Windows XP? - Stack Overflow

The other evening I turned off my Windows XP system and busied myself with other matters, only to find the machine churning away several minutes later as it worked through its shutdown process.

Description of Windows Search 4. For more information, refer to this Microsoft web page: Support is ending for some versions of Windows. More Information Windows Search 4. The search engine in Windows Search 4. Support for indexing encrypted documents of local file systems Reduced effect on Microsoft Exchange when you index e-mail in online mode, and there is no local cache. Computer policies Prevent adding Universal Naming Convention UNC locations to index from Control Panel Prevent customizing indexed locations in Control Panel Prevent automatically adding shared folders to the index Allow for indexing of encrypted files Disable indexer back-off Prevent clients from querying the index remotely Allow for indexing of online delegate mailboxes Prevent adding user-specified locations to the All Locations menu Enable throttling for online mail indexing Per-user policies Prevent adding UNC locations to the index from Control Panel Prevent customizing indexed locations in Control Panel Prevent indexing certain paths Default excluded paths Windows Search 4. The Group Policy template Search. This add-in also lets Windows Search index shared items on remote networks. By default, this add-in is included for supported bit operating systems. When you install the Windows Search 4. Note To install Windows Search 4. Also, Terminal Services must be running for Windows Search 4. By default, Terminal Services is configured to start automatically. However, it may have been disabled manually or by third-party software. If Terminal Services is disabled, the installation of Windows Search 4. To determine the status of Terminal Services, and start the service if it is disabled, follow these steps: Click Start, click Run, type services. If the Status of the service is not set to Started, right-click the service, and then click Properties. In the Startup type list, click Automatic, click Apply, and then click Start. Note If the installation of Windows Search 4. For Windows Search 4.

Chapter 2 : How to Install Windows XP (with Pictures) - wikiHow

Windows XP In An Instant is an excellent introduction to XP (both versions). I found the book to be simple and concise and it includes voluminous screen shots of almost every topic covered. This is NOT a book for advanced users.

All versions of the feature are popularly referred to as SPAD. For this reason, developers are encouraged to register for the Set your default programs Control Panel item so that any user can manage application defaults. Each of these values is discussed in detail in the following sections. Use quotation marks appropriately to ensure that spaces in the command line are not misinterpreted. The Reinstall Command The reinstall command line declared in the ReinstallCommand value is executed when the user uses the Set Program Access and Computer Defaults page to select your program as the default for its client type. The program launched by the reinstall command line must associate the application with the complete set of file and protocol types the application can handle. All applications must establish handler capability in the reinstall command. Applications can use the reinstall command to register capability as well as optionally establish default status. When an application chooses to implement both capability and default handler status in the reinstall command, it should also reinstate any visible links or shortcuts desired. The visible entry points most applications choose are listed in The Hide Icons Command. Once the reinstall process is complete, the program launched by the reinstall command line should exit. It should not launch the corresponding program; it should merely register defaults. See Start Menu Registration for additional information. The specific guidelines are to remove shortcuts and icons from the following locations: Desktop icons Start menu links, including the Startup group Quick Launch bar links Shortcut menus Folder task band This command line must also prevent automatic invocations of the program, such as those specified in the Run registry key. You do not need to relinquish registration application capability of file types when icons are hidden. Doing so can lead to a bad user experience when these types are encountered in the UI. After successfully hiding icons, you must update the IconsVisible registry value to 0 as shown: An alternative method that achieves the same effect is to uninstall the application. The section below shows example behavior and sample code to implement this alternative. In general, independent software vendors ISVs should avoid this alternative since it will: Uninstall the application completely from the system. Remove previously selected defaults. Leave no UI option to reinstall the application. Make the enable access feature no longer available, since an uninstallation removes the application completely from SPAD. The recommended user experience is as follows: When the user selects OK, the Programs and Features Control Panel item launches to allow the user to uninstall the application. The following code provides a reusable implementation for the Hide Access feature as outlined above. The visible access points of interest to most applications are listed in The Hide Icons Command. The application should not change per-user defaults; that change should be done by the user through Default Programs. After successfully showing your icons, you must update the IconsVisible registry value to 1 as shown: As part of system preparation, an OEM can establish a configuration that hides access points for the Microsoft browser, email, media playback, instant messaging, or virtual machine for Java client programs and specifies their own default programs. OEMs can enable users to reset their computers at any time to this default configuration by setting the following registry values. If these keys are not set, the Computer Manufacturer option is not shown. The OEMShowIcons entry, if present, sets the icon show state for the specified client that is applied if the user selects Computer Manufacturer. A value of 1 causes icons to be shown, and a value of 0 causes icons to not be shown. Only one client of a particular type can be marked as the OEM default. If the OEMDefault entry is not present or is present and set to 0, then that particular client is not used as the default client if the user selects Computer Manufacturer. In addition to the option to reset their computers to the default configuration established by the OEM, users have three other configuration options: Set their computer to a Microsoft Windows configuration. In this case, the Set Program Access and Computer Defaults page enables access to all Microsoft and non-Microsoft software on the computer registered in the relevant product categories. Microsoft Windows programs are selected as the default option for each category. Set their computer to a non-Microsoft configuration. It enables access to the non-Microsoft software on the

computer in these categories. Furthermore, if a non-Microsoft program is available in a category, it is set as the default for that category. If more than one non-Microsoft program is available in a category, the user is asked to choose which non-Microsoft program should be used as the default. Establish a custom configuration. Users make their own selections for enabling or removing access, mixing Microsoft and non-Microsoft programs as they see fit. Users establish default options on a category-by-category basis. Users are free to change any of these options at any time. In this case the command line switches allow the Litview. Registration Elements for Specific Client Types The following information also can be found in the resources listed in the Related Topics section at the end of this topic. However, the registration discussed in this section should still be performed because it assigns the default MAPI client. For this reason, developers are encouraged to register for the Set your default programs Control Panel item so that any user can manage per-user application defaults. Selections made in SPAD should only affect per-machine settings. Set the registry value as follows. Set values and keys that mirror those settings under the following key. The hierarchy remains the same, only the location has changed. Typically, the mailto protocol is registered to a program rather than an asynchronous protocol, in which case the documentation on Registering an Application to a URI Scheme applies. The following example shows the mailto section of the registration for a mailto handler registered to a program.
