

Chapter 1 : North American fish comes in yellow and blue - CodyCross Answers Cheats and Solutions

Fulfillment by Amazon (FBA) is a service we offer sellers that lets them store their products in Amazon's fulfillment centers, and we directly pack, ship, and provide customer service for these products.

Flathead catfish reach a length of 3 to 4 feet 0. *Pylodictis* is Greek meaning "mud fish", and *olivaris* is Latin for "olive-colored". The belly is usually pale yellow or cream colored. The head is broadly flattened, with a projecting lower jaw. The tail fin is only slightly notched, not deeply forked as is the case with blue and channel catfish. Young fish may be very dark, almost black in appearance. Life History Unlike other catfish which are scavengers, flatheads prey only on live fish. Young flathead catfish feed mostly on invertebrates such as worms, insects and crayfish. When 10 inches or larger, their diet consists entirely of fish: Flathead catfish are eaten by alligators, water snakes, turtles, larger fish, and humans. They reach sexual maturity between the third and sixth year. Males select hollow logs, caves or areas beneath the banks for their nest sites. Males may even improve their selected sites by creating shallow depressions for the females to lay their eggs. Egg number varies greatly depending on female size, but the average is up to , eggs at a time. Scientists estimate that a female will lay eggs for every pound she weighs. A female flathead that weights 50 pounds might release 60, eggs at a time. After an incubation period of four to six days, the fry very young fish will school together at the nest for several days after hatching; afterwards they will seek shelter beneath rocks, roots and other cover and begin their independent lives. Average lifespan of the flathead catfish is 12 to 14 years, but one recorded flathead catfish lived 24 years. Adults are usually solitary, each staking out a favorite spot under a tree or in a cove, in deep water. At night, they move into shallow areas to feed. Males defend their nest and eggs aggressively. They will fan the nest with their tails to keep the eggs clean and provide them with oxygenated water. If females have been eating poorly, their bodies may conserve resources by not releasing eggs. In healthy times, clutches can reach , eggs, but only a small number will survive. Habitat Flathead catfish prefer deep pools of streams, rivers, canals, lakes and reservoirs, where the water is turbid cloudy and the currents are slow. Distribution Flathead catfish range from the lower Great Lakes through the Mississippi River watershed to the Gulf states. Other In size, flatheads are the second largest sport fish in Texas after their cousin, the blue catfish. Where mature populations exist, pounders are not unusual. Typically, the largest fish are caught by trotliners, who have landed specimens in excess of pounds. Rod and reel anglers may have the greatest success with flathead catfish just below reservoir dams. Because of their popularity with anglers, they have been introduced in many other states where they have adapted well. In some cases, however, they have out-competed the native fish species, causing those native fish populations to decline sharply, disrupting some natural ecological processes. The fish are in four basic colors (yellow, blue, red, green), five different kinds (four of each per color), four different sizes (making each fish totally unique), and backed with Velcro-like hook material so they adhere well to the fishbowls even when picked up.

Fish can be the perfect pet for children who are thrilled by the presence of colourful creatures. Others go to the aquarium and enjoy watching a vast variety of fish apart from experiencing peace and serenity that the movements of these fishes offer. A few venture further and do snorkeling to watch the real world of fish in their natural habitat under the sea and enjoy actual movements of colourful fish as a recreational activity. There are different species of fishes and they are of different colours too. I have chosen a few yellow coloured fishes with spectacular shapes and structures for this article. Watching videos will provide you with an opportunity to appreciate their movements from close quarters.

Longhorn Cowfish *Longhorn Cowfish - Lactoria cornuta* Source This fish has acquired its name because it resembles a cow having long protruding thorns on its head. The thorns have the capability to regrow when broken. They can be of other colours and often have white spots on their bodies. Their flesh is poisonous which makes it not so attractive to the predators. Being slow swimmers can easily be caught and are known for making grunting sounds.

Yellow Trumpet Fish *Yellow trumpet fish - Aulostomus chinensis* Source Unlike other fishes, Trumpet fishes have very elongated bodies with small jaws at one end. These fishes can swim vertically and also align themselves with other objects pretending as part of the object and this ability is used by them as a trap to prey. They may look like motionless sticks to other swimming objects in the sea. They can go up to 30 metres deep into the water and grow up to 31 inches. They use sucking action to swallow small fish. Watch the activities of a yellow Trumpet fish

3. Bluecheek Butterfly Fish *Bluecheek Butterfly Fish - Chaetodon semilarvatus* Source This fish is normally bright yellow in colour with beautiful orange stripes on both sides. Also there is a dark patch behind the eyes. Mostly kept as pairs in aquariums, this disk-shaped fish is another very peaceful creature. Its habitat is Red Sea and Gulf of Aden and can be seen in aggregations of up to 20 and generally feeds on live coral. In fact, their presence in good numbers is an indicator of the health of coral reef in a particular area. Watch slow motion of Bluecheek Butterfly Fish

4. Its dorsal fin has a black bar at the top on the elongated body. It is known to be dwarf normally not exceeding 4 to 5 inches in size and temperamentally cool and quite fish. Mothers carry, hatch and develop the eggs in their mouths. East Africa and Lake Malawi are their known habitat. Longsnout Seahorse *Longsnout Seahorses* can be of different colours including mustard yellow. Normally there are many dark spots on the body looking like decoration. Males have a pouch on their belly. Being very cool, they are popular for aquarium. They are known for their affinity to coral reefs as also for sea grass beds.

Longsnout Seahorse *Hippocampus reidi*

6. Yellow Tang *Yellow tang fish - Zebrasoma flavescens* Source One of the extremely popular among home saltwater aquarium fish due to its bright colour which tends to fade away slightly at night. This oval shaped fish normally remains active and is non-aggressive which adds to its popularity. It is known to be a grazing fish which likes algae, lettuce and even grass, though can take even shrimp.

Yellow Boxfish *Fading of Yellow Colour Faded colour of Old Yellow Boxfish - Ostracion cubicus* Source Named after the shape, the Yellow Boxfishes are really very bright in colour when in juvenile stage, but it tends to fade away as these fishes get old. It has black spots throughout. Reaching a maximum of 45 centimeters in length, these are found in the temperate marine water of Pacific Ocean, Indian Oceans and in Atlantic Ocean. Starting from the central coast of Western Australia the presence of yellow boxfish is felt in the north and east coasts also. Coral and rocky reefs are the natural habitat for these fishes.

Yellow Goatfish *Yellow goatfish - Parupeneus cyclostomus* Source Also called yellow saddle goatfish, these small-eyed, yellowish gray adults are found on coral or rubble bottoms of reef flats in Red Sea, Hawaii, Maldives and South Africa. They eat small fish, shrimps and crabs during daytime. Large fish can live solitary but the juveniles in schools.

Foxface Rabbitfish *Foxface rabbitfish - Siganus vulpinus* Source Another bright yellow coloured fish of medium size with black-brown and white stripes on the head and also the front portion. They have long snout-like mouth which helps in eating vegetation and algae. The
